Application Development and Platforms for Technical Professionals Overview

Gartner

Gartner (February 2019)

Application developers are typically the most technical contributors in an organization, but the challenges of properly defining, targeting and scaling their work are significant. Modernizing their efforts, encouraging the adoption of new methodologies and successfully introducing modern platforms require a significant evolution within a development organization. Cultural obstacles must also be addressed, many of which reach well outside of a development organization. These organizations require a new core approach to be successful — their DNA must change.

Digital DNA consists of novel ideas, practices and technologies that fuse with existing base development activities to rapidly affect positive change. For practitioners, splicing in digital DNA will require:

- Design thinking and reuse of components to be elevated to the forefront as a priority area of expertise for development
- New frameworks and tools to be adopted in order to address new app opportunities, and for developers to aggressively tackle these new development technologies

- A continuous product quality and business agility mindset across development and IT operations to enable continuous delivery of engaging experiences

Topics

Application development continues to evolve in its sophistication, while the business expects solutions to be delivered faster than ever. Gartner's developer-facing research over the next year will address the following client questions:

- How do I improve my practices, processes, tools and infrastructure to speed software delivery and improve software quality?
- What frameworks, tools and practices should I use to build great web applications?
- What frameworks, tools and practices should I use to build great mobile apps?
